

# MS(x)

**Meta Service (Extensions)**

The data shadow for your data.

[www.ontolis.com](http://www.ontolis.com)

## DEFINITION

MS is a metadata platform consisting of a web-based editor and a database. Metadata is maintained in the CMS und configured in MS.

Meta Service Extensions (MSx) is a pure code component that offers an extension for any metadata platform. MSx optimally requires the functionality of MS for realizing full potential.

## FEATURES & BENEFITS of MS

Classifies CMS objects

Maps CMS objects to MS objects

Manages rules for complex validity statements

Uses the validities in the CMS

Maintenance in the CMS - configuration in MS

Searches in CMS based on metadata

Rule-based filtering of document structures

Generates document variants

Connects to any inventory system

## FEATURES & BENEFITS of MSx

Presenting metadata

Processing metadata without its own database

Rule-based filtering of document structures

Generating document variants

XML-import for metadata, e.g. for CDP
